# The #HashPanda Project

HashPanda's mission is to become the most decentralized and fairly distributed meme-token. We pioneered a distribution mechanism which allows us to distribute tokens in a social way, preventing whale-dumps and thus creating a safe-haven asset that can serve as a piggy bank for years to come. Additionally, token holders receive 3% of all transactions, providing the benefit of automatic yield farming.v

# The Problem

HashPanda solves the problem of unfair token distributions and frequent whale dumps. Using Dogecoin as an example: the largest holder owns 28% of all tokens. This holder alone could crash the price by an estimated 96%.

Most other tokens have a similar uneven supply distribution. For these tokens, a handful of individuals own major parts of the supply, resulting in continuous dumps and unsustainable price pressure in the long-term.

# The Solution

HashPanda solves this problem by pioneering a social distribution mechanism. This mechanism is responsible for distributing 40% of the allocated PANDA supply to a wide range of token holders (500,000 to 1 million token holders, to be precise), making HashPanda the most decentralized meme-token.
This is done by programmatically subscribing to all transactions on Binance Smart Chain (which are public by nature) and picking a couple thousand winners daily, who are rewarded with PANDA tokens. The receivers of PANDA tokens usually become long-term holders and loyal project supporters.

# Decentralized Distribution

We believe this is the fairest and most sustainable approach for a decentralized token. It plays a large role in ensuring the future token value remains stable and serves as an effective anti whale measure. The process is estimated to take between 4 and 8 weeks, until the allocated supply of 400 trillion PANDA tokens is fully distributed.
